## CodeIgniter and Ajax Using JQuery Tutorial

I created this tutorial because I was having a hard time finding good simple [CodeIgniter](#) + [JQuery](#) tutorial for newbie like me. [The one I found](#), created by MR Forbes, is hard to understand and apparently isn't working. [Another one](#), pr0digy's, is using Mootools for the AJAX framework.

So I decided to create my own CodeIgniter and JQuery tutorial based on pr0digy's tutorial. I'm assuming you already know how to code using CodeIgniter. If you're new to CodeIgniter, you need to find others tutorial first. [The videos](#) given in CodeIgniter's site is a good start.

This tutorial is about creating simple CodeIgniter + database + ajax system. User will be shown a form to post a message. Then after he/she press the submit button, the system will save the message using ajax and then show the message. You could see [the result](#) first if you want.

### Database

The first thing we need to do is creating a table to save the message. For this tutorial, We will use this:

```
1 CREATE TABLE IF NOT EXISTS `messages` (  
2   `id` tinyint(4) NOT NULL  
3   AUTO_INCREMENT,  
4   `message` VARCHAR(256) NOT NULL,  
5   PRIMARY KEY (`id`)  
6 )
```

### Controller

Then, we need to create a controller. My controller is named `message`. You could name your controller any name you like. After that, create 2 functions/methods, `view` and `add`.

`view` is used to get the default view and list of messages from the database.

The codes are:

```

1 function view($type = NULL)
2 {
3     // get data from database
4     $data['messages'] = $this->Message_model->get();
5
6     if ($type == "ajax") // load inline view for call from
7     ajax
8         $this->load->view('messages_list', $data);
9     else // load the default view
10        $this->load->view('default', $data);
11 }

```

We fetch messages from the database using `Message_model->get()` function. Then the data is passed to the view. Here, we have 2 views called. One for the default view, where we called the page using `message/view`, and the other is for calling from ajax.

`add` is a process used to insert the message to the database. The codes are:

```

1 function add()
2 {
3     // if HTTP POST is sent, add the data to database
4     if($_POST && $_POST['message'] != NULL) {
5         $message['message'] = $this->input-
6 >xss_clean($_POST['message']);
7         $this->Message_model->add($message);
8     } else
9         redirect('message/view');
10 }

```

This function is accessed when we press the submit button from the form. This function will save the message using `Message_model->add()` function.

## Model

The next thing we need to create is the model. I use `Message_model` for the name. Here we create two functions, `add` and `get`. `add` is a function to insert the data into the database. `get` is a function to retrieve data from database. I think the codes are pretty self-explanatory, but you could drop me a message if you need some explanations on the codes.

```

1 function add($data)
2 {
3     $this->db->insert('messages',
4 $data);
5 }

```

```

1 function get($limit=5, $offset=0)
2 {
3     $this->db->orderby('id', 'DESC');
4     $this->db->limit($limit, $offset);
5
6     return $this->db->get('messages')-

```

```

7 >result();
  }

```

## View

I use 2 files for view section. default.php and message\_list.php. The message\_list is used for displaying the messages taken from the database.

```

1 <!-- default.php -->
2 <div id="form">
3     <input type="text" id="message" name="message" />
4     <input type="submit" id="submit" name="submit" value="submit" />
5 </div>
6 <div id="content">
7 <?php $this->load->view('messages_list') ?>
8
9 </div>

```

```

1 <!-- message_list.php -->
2 <ol>
3 <?php foreach ($messages as $message):
4 ?>
5     <li><?= $message->message ?></li>
6 <?php endforeach ?>
7 </ol>

```

Hey, Where's the JQuery?

Here we go. The last, and maybe the most important part of this tutorial. So, we the our controller, we had the model, and we had the views. I assume you already know how to include a jquery script to your view. The jquery codes are this:

```

1 $(document).ready(function() {
2     $('#submit').click(function() {
3
4         var msg = $('#message').val();
5
6         $.post("<?= site_url('message/add') ?>", {message: msg},
7 function() {
8     $('#content').load("<?= site_url('message/view/ajax') ?
9 >");
10    $('#message').val('');
11    });
12    });
13    });

```

So, when we click the submit button, the javascript will take the value of input textbox then send it to message/add using post method. When the action succeed, the script will call message/view/ajax. Note the ajax keyword. It will call the message\_list view instead of the default one. Then the view will replace the content in div#content tag.

Well done. You could see [the demo I made from the tutorial](#).

You could download the whole files used in this tutorial in [tutorial.zip \(1.98 KB\)](#).

Or, if you prefer to get one by one,  
[controller: message \(904 bytes\)](#)  
[model: message model \(583 bytes\)](#)  
[view: default \(782 bytes\)](#)  
[view: message list \(111 bytes\)](#)

I hope this tutorial helps newbie like me. If you have any question, just drop a comment below 😊

I would highly recommend changing your function (method) from the name 'view' to the name 'display' as it would most likely cause less confusion as view is the name given to displaying views in the MVC pattern.

If you changed it, it would be like this:

To load a view, the call is `$this->load->view('welcome');`

To load your display: `$this->display();`

Less confusing when you aren't using a CI method name for your functions.

Anybody figured out why this doesn't work properly on Internet Explorer? (I'm using IE8 and it still doesn't work).

The problem is that the very FIRST input to the form gets displayed, but second, third or anything after that do not get re-loaded onto the message-list view. However, the data gets inserted into database fine.

It works on FireFox.

hi Dinesh,  
you could create another view for form, and change the add function in controller to something like this:

```
funtion add() {  
  
    $this->load->library('form_validation');  
  
    if ($this->form_validation->run() === FALSE) {  
  
        $this->load->view('add_form');  
  
    } else {  
  
        // add to database  
  
    }  
  
}
```

then you call the add function via jquery to show the form.

For those who are having the IE problem, here is the fix.

The issue is in regards to IE caching and each time it attempts to load the "div" given the URL, it thinks it's loading the same content.

So, a quick fix would be to "confuse" IE that each time you post a comment, it is a new URL we are re-loading. And we can achieve this by giving a random integer attached to the end of the URL.

Here's the code :

```
$(document).ready(function()
{
$('#submit').click(function()
{
var msg = $('#message').val();
var load_url = "?random=" + Math.random()*99999;

$.post("", {message: msg}, function() {
$('#content').load(load_url);
$('#message').val("");
});
});
});
```

Hope that helps.

You can also always use jQuery's "append()" method to re-load the page, something like

```
...
$('#content').append('new comment that was just posted...!');
```

...

Hi, I really need your help. I am using code ignitor for CRUD. Do you include jquery lib in each of your view scripts. i just added an onclick event for a href link and in js i am popping up an alert box, it doesnt work.

Thanks

Thanks for posting this, but neither demo nor code works correctly with ie6. It was reported earlier but not answered. What might be the reason? After loading the page it is possible on add and show one new record. After that submit doesn't change screen appearance but shown new record after browser refresh (but that not the way to use it)... Any advice?

You really should be more careful. You're not validating any user input! This is dangerous! You should really take away the demo before any damage is done.

nice article..i've implemented, and it works..thx..

but, can you write article about CI + ajax + thickbox or CI + ajax + extjs..  
in simple case, can you explain how to insert data to database with JQuery ajax then load modal box with thickbox, after that the data load to extjs grid

thx

for this part...

```
$(document).ready(function() {  
    $('#submit').click(function() {
```

```
        var msg = $('#message').val();
```

```
        $.post("", {message: msg}, function() {  
            $('#content').load("");  
            $('#message').val("");  
        });  
    });  
});
```

how could i add more element to it ?  
you are using json way ?

the link works.

before this i found that when the URL like:  
localhost/codeigniter/index.php/message/view

when it got another / after index.php  
then i have to include extra "../" to the original "../jquery.js".

if localhost/codeigniter/index.php/message/view/  
another / behind view.

then i have include "../.." to the include link.

but your reference link solve the problem.  
it help lots.....  
thanks lots...

Hi, Brian where the \$type variable is set?

```
function view($type = NULL)
{
...
if ($type == "ajax") // load->view('messages_list', $data);
....
}
```

In your code it does not appear anymore. is it set by jquery?

oh...yeah...if the view files is out of view folder...  
then i will have bit problem to included.

so how about css? same way how the jquery file done ?

Like

Reply

lawrence 3 years ago

i want to include files like header and footer that shared.

so in CI include is not preferred?

hmm..i think i can get your idea....  
just use controller to load view of header and footer....

that might works....haha....thanks

Like

Reply

lawrence 3 years ago

i wondering how to include the jquery.  
cause i also been following MR Forbes example..  
although can get the first page running. But when it load back the page again, it not  
running anymore.

i put my file like this :

www/codeigniter/system <-- this is for all the system files.

i put my javascript jquery  
www/codeigniter/javascript/jquery.js

in the view, i include like this

it can run when i type my URL like this  
localhost/codeigniter/index.php/message

but not when  
localhost/codeigniter/index.php/message/view

can guide me how to really put the jquery files ?  
thanks !!~
