ASP.NET MVC----HandleError

ASP.NET MVC——扩展过滤器

ASP.NET MVC——OutputCache

.Net MVC 2009-10-26 16:23:48 阅读32 评论0

字号: 大中小

示例程序

- 1.在Action上标记启用缓存,如: [OutputCache(Duration = 5, VaryByParam = 'none')]
- 2.在Action上标记禁用本地缓存,如: [OutputCache(Location = System.Web.UI.OutputCacheLocation.None)]
- 3.在Action上标记使用缓存依赖,如: [OutputCache(Duration = 9999, VaryByParam = 'none', SqlDependency ='Demo:UserInfo')]

使用缓存依赖的要点

- 1.在Web.config中添加数据库连接字符串,如下:
 - <connectionStrings>
 - ..<add name="DemoConn"
 - connectionString="server=.\SQLEXPRESS;database=Demo;uid=sa;pwd=123456" providerName="System.Data.SqlClient"/>
 - </connectionStrings>
- 2.在Web.config中添加缓存配置,如下:
 - <caching>
 - ..<sqlCacheDependency enabled="true" pollTime="2000">

prophe

在人的骨髓中有一种元素 叫坚强,纵使风吹、日晒、 雨淋,它依然不减,坚持信 念,继续

C# OOP学习曲线

[品] 从老板到程序员 我思教育

[摘]导致职场不成功十五□ 用人标准

捕鱼分鱼问题[回溯算法]

```
....<databases>
       ......<add name="Demo" connectionStringName="DemoConn" />
       ....</databases>
       ..</sqlCacheDependency>
       </caching>
 3.在Global.asax.cs中以编程的方式启用缓存依赖,如下:
       protected void Application_Start()
       ..string connStr =
       System.Configuration.ConfigurationManager.ConnectionStrings["DemoConn"].ConnectionString;
       ..System.Web.Caching.SqlCacheDependencyAdmin.EnableNotifications(connStr);
       ..System.Web.Caching.SqlCacheDependencyAdmin.EnableTableForNotifications(connStr, "UserInfo");
 4.使用命令行注册依赖,如下:
       aspnet_regsql -S .\sqlexpress -E -d DBName -ed
       aspnet_regsql -S .\sqlexpress -E -d DBName -t TableName -et
示例如下:
[HandleError]
    public class CacheHandlerController : Controller
        public ActionResult Index()
             return View();
```

```
[OutputCache(Location = System.Web.UI.OutputCacheLocation.None)]
       public ActionResult RenderWithOutCache()
           ViewData["Now"] = DateTime.Now;
          return View("RenderCache");
      [OutputCache(Duration = 5, VaryByParam = "none")]
       public ActionResult RenderCache()
           ViewData["Now"] = DateTime.Now;
          return View();
       [OutputCache(Duration = 9999, VaryByParam = "none", SqlDependency = "Demo:User
Info")]
       public ActionResult SqlCacheDependency()
           ViewData["Now"] = DateTime.Now;
           return View("RenderCache");
自定义过滤器
1.ASP.Net MVC内置四类过滤器分别为: IAuthorizationFilter IActionFilter IResultFilter IExc
eptionFilter
2.关于过滤器的说明上述过滤器在使用上存在优先级,且依序从高到低可通过实现对应的接口创建自定义的过滤器
3. 自定义过滤器,示例(...)
示例如下
[AttributeUsage(AttributeTargets.Class | AttributeTargets.Method, Inherited = true, Al
lowMultiple = true)]
   public class TraceAttribute : FilterAttribute, IActionFilter, IResultFilter
       #region Properties
       public string LogName { get; set; }
```

```
#endregion
#region IActionFilter Members
public void OnActionExecuting(ActionExecutingContext filterContext)
   LogMessage(
       filterContext.RouteData.Values["controller"].ToString(),
       filterContext.RouteData.Values["action"].ToString(),
       "Action executing..."
   );
public void OnActionExecuted(ActionExecutedContext filterContext)
   LogMessage(
       filterContext.RouteData.Values["controller"].ToString(),
       filterContext.RouteData.Values["action"].ToString(),
       "Action executed."
   );
#endregion
#region IResultFilter Members
public void OnResultExecuting(ResultExecutingContext filterContext)
   LogMessage(
       filterContext.RouteData.Values["controller"].ToString(),
       filterContext.RouteData.Values["action"].ToString(),
       "Result executing..."
   );
public void OnResultExecuted(ResultExecutedContext filterContext)
```

```
LogMessage(
               filterContext.RouteData.Values["controller"].ToString(),
               filterContext.RouteData.Values["action"].ToString(),
               "Result executed."
           );
        #endregion
        #region Helper methods
        private void LogMessage(string controller, string action, string message)
        #endregion
                                                                 ==>ASP.NET MVC实战汇编
                                                              阅读(32) | 评论(0) | 引用(0) | 举报
